

# elcometer® **195 Saberg Drill**

For some coating / substrate combinations it is necessary to use a destructive method. Whereas a Paint Inspection Gauge (P.I.G.) makes a cut along the coating, the Elcometer 195 Säberg Drill makes a small hole in order to measure the coating thickness layer thus a much less damage is done.

- Ideal for hard or brittle coatings
- Measures coatings up to 1500µm
- Used in conjunction with a graticule scale microscope (included)
